I am concerned that the introduction of hydraulic fracking in Western Australia will have dire consequences for the water supply needed for our food production areas. The amount of water required for the fracking process together with the potential contamination of underground aquifers presents a real threat to our future food security.

Studies such as the Louisiana Ground Water Resources commission on managing Louisiana's water point to real issues when it comes to ground water contamination.

Until I can be assured that no impact whatsoever will be forthcoming with the introduction of fracking in WA to our food growing areas, I would urge that fracking be banned.
